

# Mechanics and the Foundations of Modern Physics

T. Helliwell

V. Sahakian

# Contents

<b>1</b>	<b>Newtonian particle mechanics</b>	<b>3</b>
1.1	Inertial frames and the Galilean transformation . . . . .	3
1.2	Newton's laws of motion . . . . .	6
	<i>Example 1-1: A bacterium with a viscous drag force</i>	
	<i>Example 1-2: A linearly damped oscillator</i>	
1.3	Systems of particles . . . . .	13
1.4	Conservation laws . . . . .	16
	<i>Example 1-3: A wrench in space</i>	
	<i>Example 1-4: A particle moving in two dimensions with an attractive spring force</i>	
	<i>Example 1-5: Particle in a magnetic field</i>	
	<i>Example 1-6: A child on a swing</i>	
	<i>Example 1-7: A particle attached to a spring revisited</i>	
	<i>Example 1-8: Newtonian central gravity and its potential energy</i>	
	<i>Example 1-9: Dropping a particle in spherical gravity</i>	
	<i>Example 1-10: Potential energies and turning points for positive power-law forces</i>	
1.5	Forces of Nature . . . . .	33
1.6	Dimensional analysis . . . . .	35
	<i>Example 1-11: Find the rate at which molasses flows through a narrow pipe</i>	
1.7	Synopsis . . . . .	38
<b>2</b>	<b>Relativity</b>	<b>49</b>
2.1	Foundations . . . . .	49
2.1.1	The Postulates . . . . .	49
2.1.2	The Lorentz transformation . . . . .	51
	<i>Example 2-1: Rotation and rapidity</i>	

2.2	Relativistic kinematics . . . . .	58
2.2.1	Proper time . . . . .	58
2.2.2	Four-velocity . . . . .	62
	<i>Example 2-2: The transformation of ordinary velocity</i>	
	<i>Example 2-3: Four-velocity invariant</i>	
2.3	Relativistic dynamics . . . . .	67
2.3.1	Four-momentum . . . . .	67
	<i>Example 2-4: Relativistic dispersion relation</i>	
	<i>Example 2-5: Decay into two particles</i>	
2.3.2	Four-force . . . . .	73
2.3.3	Dynamics in practice . . . . .	75
	<i>Example 2-6: Uniformly accelerated motion</i>	
	<i>Example 2-7: The Doppler effect</i>	
2.3.4	Minkowski diagrams . . . . .	80
	<i>Example 2-8: Time dilation</i>	
	<i>Example 2-9: Length contraction</i>	
	<i>Example 2-10: The twin paradox</i>	
<b>3</b>	<b>The Variational Principle</b>	<b>101</b>
3.1	Fermat's principle . . . . .	101
3.2	The calculus of variations . . . . .	103
3.3	Geodesics . . . . .	111
	<i>Example 3-1: Geodesics on a plane</i>	
	<i>Example 3-2: Geodesics on a sphere</i>	
3.4	Brachistochrone . . . . .	115
	<i>Example 3-3: Fermat again</i>	
3.5	Several Dependent Variables . . . . .	120
	<i>Example 3-4: Geodesics in three dimensions</i>	
3.6	Mechanics from a variational principle . . . . .	122
3.7	Motion in a uniform gravitational field . . . . .	124
3.8	Summary . . . . .	129
<b>4</b>	<b>Lagrangian mechanics</b>	<b>139</b>
4.1	The Lagrangian in Cartesian coordinates . . . . .	139
4.2	Hamilton's principle . . . . .	141
	<i>Example 4-1: A simple pendulum</i>	
	<i>Example 4-2: A bead sliding on a vertical helix</i>	
	<i>Example 4-3: Block on an inclined plane</i>	

4.3	Generalized momenta and cyclic coordinates . . . . .	149
	<i>Example 4-4: Particle on a tabletop, with a central force</i>	
	<i>Example 4-5: The spherical pendulum</i>	
4.4	Systems of particles . . . . .	156
	<i>Example 4-6: Two interacting particles</i>	
	<i>Example 4-7: Pulleys everywhere</i>	
	<i>Example 4-8: A block on a movable inclined plane</i>	
4.5	The Hamiltonian . . . . .	164
	<i>Example 4-9: Bead on a rotating parabolic wire</i>	
4.6	The moral of constraints . . . . .	170
4.7	Small oscillations about equilibrium . . . . .	172
	<i>Example 4-10: Particle on a tabletop with a central spring force</i>	
4.8	Relativistic generalization . . . . .	174
4.9	Summary . . . . .	176
<b>Appendices</b>		<b>187</b>
<b>Appendix A When is <math>H \neq E</math>?</b>		<b>187</b>
<b>5 Beyond The Basics I</b>		
5.1	Classical waves . . . . .	191
	<i>Example 5-1: Two-slit interference of waves</i>	
5.2	Two-slit experiments with light and atoms . . . . .	199
5.3	Feynman sum-over-paths . . . . .	203
5.4	Two slits and two paths . . . . .	207
5.5	No barriers at all . . . . .	215
	<i>Example 5-2: A class of paths near a straight-line path</i>	
	<i>Example 5-3: How classical is the path?</i>	
5.6	Path shapes for light rays and particles . . . . .	220
	<i>Example 5-4: Path shape for particles in uniform gravity</i>	
5.7	Why Hamilton's principle? . . . . .	224
5.8	Conclusions . . . . .	226
<b>6 Symmetries and Conservation Laws</b>		<b>233</b>
6.1	Cyclic coordinates and generalized momenta . . . . .	234
	<i>Example 6-1: A star orbiting a spheroidal galaxy</i>	
	<i>Example 6-2: A charged particle moving outside a charged rod</i>	
6.2	A less straightforward example . . . . .	237

6.3	Infinitesimal transformations . . . . .	238
	<i>Example 6-3: Translations</i>	
	<i>Example 6-4: Rotations</i>	
	<i>Example 6-5: Lorentz transformations</i>	
6.4	Symmetry . . . . .	242
6.5	Noether's theorem . . . . .	244
	<i>Example 6-6: Space translations and momentum</i>	
	<i>Example 6-7: Time translation and the Hamiltonian</i>	
	<i>Example 6-8: Rotations and angular momentum</i>	
	<i>Example 6-9: Galilean Boosts</i>	
	<i>Example 6-10: Lorentz invariance</i>	
	<i>Example 6-11: Sculpting Lagrangians from symmetry</i>	
6.6	Some comments on symmetries . . . . .	256
<b>7</b>	<b>Gravitation and Central-force motion</b>	<b>263</b>
7.1	Central forces . . . . .	263
7.2	The two-body problem . . . . .	266
7.3	The effective potential energy . . . . .	269
	7.3.1 Radial motion for the central-spring problem . . . . .	271
	7.3.2 Radial motion in central gravity . . . . .	272
7.4	The <i>shape</i> of central-force orbits . . . . .	274
	7.4.1 Central spring-force orbits . . . . .	274
	7.4.2 The shape of gravitational orbits . . . . .	276
	<i>Example 7-1: Orbital geometry and orbital physics</i>	
7.5	Bertrand's Theorem . . . . .	282
7.6	Orbital dynamics . . . . .	284
	7.6.1 Kepler's second law . . . . .	284
	7.6.2 Kepler's third law . . . . .	285
	<i>Example 7-2: Halley's Comet</i>	
	7.6.3 Minimum-energy transfer orbits . . . . .	287
	<i>Example 7-3: A voyage to Mars</i>	
	<i>Example 7-4: Gravitational assists</i>	
<b>8</b>	<b>Electromagnetism</b>	<b>303</b>
8.1	Gravitation, revisited . . . . .	303
	<i>Example 8-1: Gravitostatic field of a point mass</i>	
	<i>Example 8-2: Gravity inside the body of a star</i>	
8.2	The Lorentz force law . . . . .	307

<i>Example 8-3: Potentials of a point charge</i>	
<i>Example 8-4: Vector potential for a uniform magnetic field</i>	
8.3 The Lagrangian for electromagnetism . . . . .	312
8.4 The two-body problem, once again . . . . .	314
8.5 Coulomb scattering . . . . .	317
<i>Example 8-5: Snell scattering</i>	
8.6 Uniform magnetic field . . . . .	321
<i>Example 8-6: Crossed electric and magnetic fields</i>	
<i>Example 8-7: Mirror mirror on the wall</i>	
<i>Example 8-8: Ion trapping</i>	
8.7 Contact forces . . . . .	337
<i>Example 8-9: Rolling down the plane</i>	
<i>Example 8-10: Stacking barrels</i>	
<i>Example 8-11: On the rope</i>	
<i>Example 8-12: A rubber wheel on a road</i>	
<b>9 Accelerating frames</b>	<b>357</b>
9.1 Linearly accelerating frames . . . . .	357
<i>Example 9-1: Pendulum in an accelerating spaceship</i>	
9.2 Rotating frames . . . . .	361
<i>Example 9-2: Throwing a ball in a rotating space colony</i>	
<i>Example 9-3: Polar orbits around the Earth</i>	
9.3 Pseudoforces in rotating frames . . . . .	365
9.4 Centrifugal and Coriolis pseudoforces . . . . .	369
<i>Example 9-4: Rotating space colonies revisited</i>	
9.5 Pseudoforces on Earth . . . . .	372
<i>Example 9-5: Coriolis pseudoforces in airflow</i>	
<i>Example 9-6: Foucault's pendulum</i>	
9.6 Spacecraft rendezvous and docking . . . . .	380
<i>Example 9-7: Rendezvous with the space station?</i>	
<i>Example 9-8: Losing a wrench?</i>	
<b>10 Beyond The Basics II</b>	
10.1 Beyond newtonian gravity . . . . .	396
<i>Example 10-1: A thought experiment</i>	
<i>Example 10-2: Another thought experiment</i>	
<i>Example 10-3: The precession of Mercury's perihelion</i>	
<i>Example 10-4: Magnetic gravity</i>	

<i>Example 10-5: Cosmic string</i>	
10.2 Relativistic effects and the electromagnetic force . . . . .	411
<i>Example 10-6: Probe in a uniform magnetic field</i>	
<i>Example 10-7: Probe in crossed uniform electric and magnetic fields</i>	
10.3 Gauge symmetry . . . . .	414
<i>Example 10-8: Fixing a gauge</i>	
10.4 Stochastic forces . . . . .	416
<b>11 Hamiltonian formulation</b>	<b>425</b>
11.1 Legendre transformations . . . . .	425
<i>Example 11-1: A simple Legendre transform</i>	
11.2 Hamilton's equations . . . . .	430
11.3 Phase Space . . . . .	434
<i>Example 11-2: The simple harmonic oscillator</i>	
<i>Example 11-3: A bead on a parabolic wire</i>	
<i>Example 11-4: A charged particle in a uniform magnetic field</i>	
11.4 Canonical transformations . . . . .	440
<i>Example 11-5: Transforming the simple harmonic oscillator</i>	
<i>Example 11-6: Identities</i>	
<i>Example 11-7: Infinitesimal transformations and the Hamiltonian</i>	
<i>Example 11-8: Point transformations</i>	
11.5 Poisson brackets . . . . .	448
<i>Example 11-9: Position and momenta</i>	
<i>Example 11-10: The simple harmonic oscillator once again</i>	
11.6 Liouville's theorem . . . . .	454
<b>12 Rigid Body Dynamics</b>	<b>463</b>
12.1 Rigid Bodies . . . . .	463
12.2 Rotations . . . . .	465
12.3 Infinitesimal Rotations . . . . .	468
<i>Example 12-1: Rotations in higher dimensions</i>	
12.4 The Euler Angles . . . . .	472
<i>Example 12-2: Angular velocity transformation</i>	
12.5 Rotational kinetic energy . . . . .	477
<i>Example 12-3: A hoop</i>	
<i>Example 12-4: Kinetic energy of a hoop</i>	
12.6 Potential Energy . . . . .	486
<i>Example 12-5: A hoop hanging by a spring</i>	

12.7 Angular Momentum . . . . .	489
<i>Example 12-6: The angular momentum of a hoop</i>	
12.8 Torque . . . . .	492
12.9 Principal Axes . . . . .	493
<i>Example 12-7: Symmetry and principal axes</i>	
<i>Example 12-8: Fixed Axis Rotation</i>	
<i>Example 12-9: Translating the hoop</i>	
12.10 Torque Free Dynamics . . . . .	499
<i>Example 12-10: A graphical picture of torque-free motion</i>	
12.11 Gyroscopes . . . . .	506
<b>13 Coupled oscillators</b>	<b>517</b>
13.1 Linear systems of masses and springs . . . . .	517
<i>Example 13-1: Weak coupling and strong coupling</i>	
<i>Example 13-2: Coupled pendulums</i>	
<i>Example 13-3: Three blocks and four springs</i>	
<i>Example 13-4: Tear down the walls</i>	
13.2 The carbon dioxide molecule . . . . .	531
13.3 Degrees of freedom . . . . .	535
<i>Example 13-5: A planar system: masses in an equilateral triangle</i>	
<b>14 Complex systems</b>	
<b>and numerical techniques</b>	<b>547</b>
14.1 Chaos . . . . .	547
14.2 Runge-Kutta . . . . .	547
14.3 Monte-Carlo . . . . .	547
14.4 Parallelization . . . . .	547
<b>15 Beyond The Basics III</b>	
15.1 Hamilton-Jacobi theory and quantum mechanics . . . . .	548
15.2 Continuum mechanics . . . . .	548
15.3 The geometry of phase space . . . . .	548

---

## BEYOND EQUATIONS

### Isaac Newton (1642-1727)

Isaac Newton was arguably the most brilliant intellect of all time, enhanced by his curiosity, ambition, and an ability to concentrate on a problem for days at a time without food or sleep.

Born in Woolsthorpe, England, Newton was admitted to Cambridge University in 1661, where his mathematics professor was Isaac Barrow, the first holder of the Lucasian Chair in Mathematics. The university closed during the plague years 1664-65, and students were sent home. During that time Newton invented calculus, discovered the law of universal gravitation, and showed by experiment

that white light consists of light of all colors. Returning to Cambridge, Newton continued to excel, so that in 1669 Barrow resigned his chair in favor of Newton.

Many of his discoveries were unknown to his contemporaries, until his friend Sir Edmund Halley finally convinced him to publish. Newton spent the years 1684-86 writing his masterpiece, the *Principia*, a task he made especially challenging by reproving all his results without calculus, so readers could understand them. Newton presented his laws of motion, derived Kepler's laws, calculated the mass of the Sun, explained the precession of the equinoxes, and much else.

Newton ultimately became Warden of the Mint, President of the Royal Society, a member of Parliament, and was knighted. Toward the end of his life he wrote: "I do not know what I may appear to the world, but to myself I seem to have been only like a boy playing on the seashore, and diverting myself in now and then finding a smoother pebble or a prettier shell than ordinary, whilst the great ocean of truth lay all undiscovered before me." Nevertheless, Newton changed the world. He died in 1727 and is buried in Westminster Abbey.
